## 1. Introduction

### 1.1 Introduction About the Project

Python is the programming language that I used to develop this project. It is a straightforward program that everyone can understand. It is widely used nowadays for constructing websites and software, task automation, data analysis, and data visualization, among many other areas. Writing is flexible.

There are many software available in the market like PyCharm, Spyder, PyDev, Idle and many others to create a python code. Among them I preferred to use Python IDLE. IDLE is an initial for Integrated Development and Learning Environment in Python. It simplifies the development of Python code for programmers. IDLE, like Python Shell, can be used to run a single statement as well as create, edit, and run Python programs. IDLE has a full-featured text editor with syntax highlighting, autocompletion, and smart indent for creating Python code. It also has a debugger that supports stepping and breakpoints. This helps in debugging. (educative, n.d.)

*Figure 1: Python Image (Logos-World, 2022)*

This is the first coursework in the Fundamental of Computing module. This program's lecturer is Hrishav Tandukar. He also conducts our workshop classes. He is kind and an excellent teacher. He does really well in this module. He has a lot of knowledge about this field. This coursework was given on week 6 and submission of this coursework on week 12. Also, this assignment counts for 60% of the module mark. The major goal of this project is to develop a Bill Generation system for a costume rental store. Because this is the first course on the subject, some of the information will be unfamiliar to us. We discussed this idea with our friends several times in order to finish it before the deadline. While we work on this project, our expert tutor assists us.

The major objective of this coursework is to develop a billing system for a costume rental store to maintain the record of costumes available for renting. In this project, I can develop the coding section into three portion file, file one is ListSplit.py, another one is ReturnCostume.py and last but not the least Main.py which basically contain the fundamental code of this coursework.

In addition to developing an algorithm, flowchart, pseudocode, and data structures as part of the assignment. We must also submit a report. It is also necessary to provide a description of the processes performed. We should also put our program to the test and report the results. It is important to show that problems were recognized and fixed. An appendix for the code part is included with the conclusion.

While doing this coursework I can use different tools like IDLE , MS-word, draw.io.

➤ IDLE

- It does not many packages to know so it simple to learn.
- It has Standard Library.
- It is mainly used by the beginner's level who want to practice python to develop its skills.
- It is one of the best IDE of Python.
- Add visual impact to our document.
- Turn our text into compelling diagram.

Figure 2: IDLE Shell

➤ MS-Word

- It is very friendly user interface to use.
- It very simple to use.
- It has many functionalities which make the user easily to do their tasks.

m

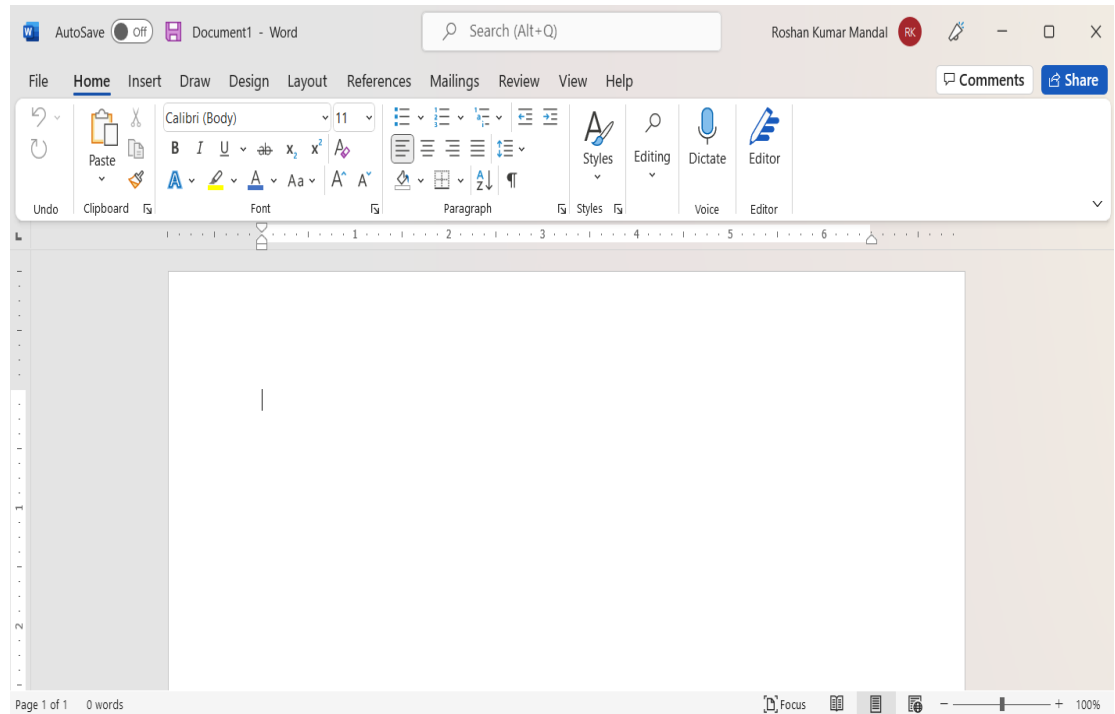

Figure 3:Figure of MS-WORD

## 1.2 Goal And Objectives

➤ Goal

The goal of this course is to create a Bill Generation System that maintains a record of the many costumes available for renting purpose in a Costume Rental Shop.

➤ Objectives

- a. It helps to maintain the track of costume available for renting purpose.
- b. It helps to update the stock of the costumes after each transaction.
- c. It helps to generate the bill for renting or returning the costume.

## 2. Discussion and Analysis

We will discuss about and look at the process of creating a Bill Generating System for a costume rental shop including the software requirements and acceptable data formats for storing information in files. The Billing system is a computerized framework that enables clients to manage their track record of renting the costume day-to-day activities digitally. It reduces the possibility of printed items being misplaced, damaged, or destroyed.

### 2.1 Algorithm

In general term, it a process or set of rules which is being followed during solving problem or performing calculations. In technical term it a well- defined instructions to solve a particular problem of program. The Algorithm of this Program is Given below:

**Step 1:** Start program

**Step 2:** Start a Loop Which runs until== "3"

**Step 3:** Read the Data from Text.txt and store it in file

**Step 4:** Take input from user

- If user==1, go to Step 5
- If user==2, go to Step 6
- If user==3, got to Step 7

**Step 5:** Rent the Costume

**Step 6:** Return the Costume

**Step 7:** Exit

**Function Of Rent Costume**

**Step 8:** Input ID of the Costume

If Costume ID is Valid, go to Step 9

Else, Provide valid Costume ID

**Step 9:** Input the quantity

If Quantity Available in Stock, go to Step 10

Else, Costume Out Of Stock, Please Visit us Again

**Step 10:** Input the Name

**Step 11:** The Rent Bill be Created

**Step 12:** Created a rent txt file

**Function of List Split**

**Step 12:** Declare ListSplit

**Step 13:** Open Text.txt file

**Step 14:** Read Lines file and Strip

- Index 0 Costume Name
- Index 1 Brand
- Index 2 Price
- Index 3 Quantity

**Function Date Time****Step 15:** get Date**Step 16:** Print Date Of Now**Step 17:** get Time**Step 18:** Print Time Of Now**Function Of Return Costume****Step 19:** If you want to return the Costume, press 2 then enter the name of person who want to return the costume**Step 20:** Input Costume ID which You want to return

If costume ID is valid, go to 21 step

Else, provide valid Costume ID

**Step 21:** Input the day you have kept the costume**Step 22:** Input Do want to return other costume

If yes, go to Step 20

Else, go to Step 23

**Step 23:** Return Bill Be Printed**Step 24:** Return Text file be created**Step 25:** Program stop if user want to terminate

## 2.2 Flowchart

A flowchart is known as symbol representation of an algorithm which is used to display how does a program should work. It can be created by using symbols like rectangle, circle, and so on and the process of creating a flowchart for an algorithm is known as flowcharting.

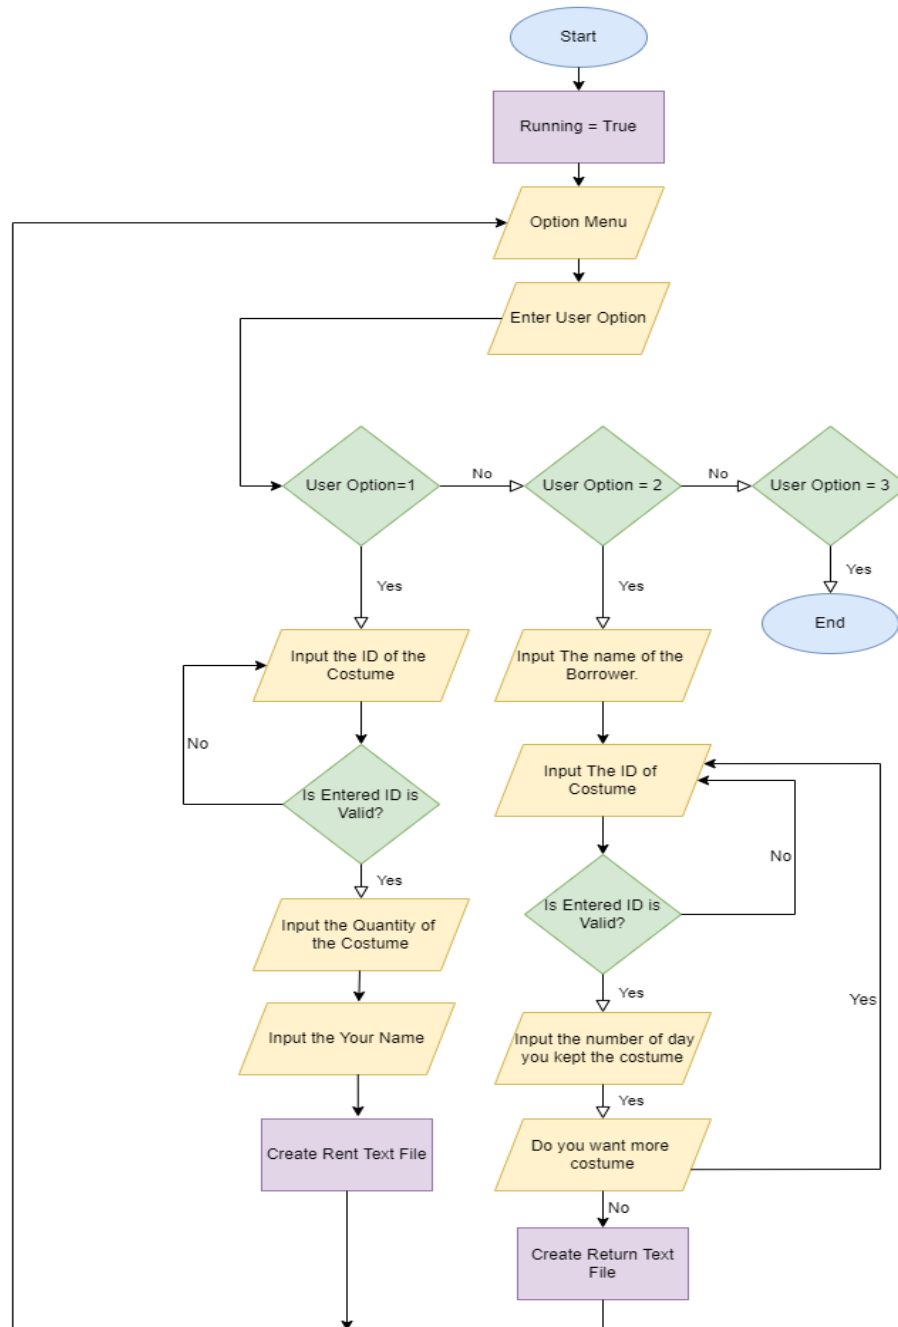

Figure 4: Flowchart of Program

## 2.3 Pseudocode

.....

## 2.4 Data Structures

Data and its information are essential components, and various implementations are being developed to store it in various ways. Computers handle data and storage precisely and quickly. Data structures control how data is assembled and stored in memory when a computer processes it. There are two types of data structures: linear and non-linear. Arrays, Queues, Stacks, and linked lists are examples of linear data types. Graphs, tree families, and table of contents are examples of non-linear structures.

### 2.4.1 List:

Lists are similar to measured arrays, which are also known as vectors in C++ and Array Lists in Java. Lists do not have to be constantly homogenous, which makes them a fantastic asset in Python. A single list can contain Datatypes such as Integers, Strings, and Objects. Lists are transient, and they may now be changed even after they have been created.

### 2.4.2 Tuple:

Tuple is a collection of Python protests similar to list. A tuple's sequence of values can be of any type, and they are filed by integer numbers. Commas are used to standardize the value of a tuple. Despite the fact that it isn't necessary, the tuple is typically defined by enclosing the sequence of values in a parenthesis, which aids in understanding Python tuples.

### 2.4.3 Set

A set is an unorganized collection of data that is effective for making, changeable, and contains no duplicate elements. The order of elements in a set is unknown, yet it may have distinct components. The primary advantage of using a set rather than a list is that it includes an extremely optimized method for determining if a certain component is present in the set.

### 2.4.4 Dictionary

The dictionary is an unorganized collection of values that is used to store data values like a map. Unlike other data types that retain a single value as an element, the dictionary maintains a key value pair. Polymorphism is not permitted in dictionary keys.

### 3. Program

For the costume Rent System, a python application was created that can keep the track of the renting and the returning costumes of the store as needed. It was quite to write this program. While writhing this program, there were several disappointments and mishaps. In any case, after studying each of those errors and learning from them, my work on the program was successfully completed. A lot of python research should be done, and more ideas regarding the program should be collected, in order to make progress on the program's aim. Following the introduction to Python, a detailed examination of the program requested for inclusion in the coursework was carried out.

The technique was established at the time to make sense of the coding path necessary to accomplish the program's goal. Following that, a flow chart was created based on a composed algorithm to demonstrate how code would be organized and executed. After incorporating ideas from the algorithm, a flowchart was created. The technique was established at the time to make sense of the coding path necessary to accomplish the program's goal. Following that, a flow chart was created based on a composed algorithm to demonstrate how code would be organized and executed. After incorporating ideas from the algorithm, a flowchart was created.

A module is a Python object with freely named features that may be linked and referenced. A module is nothing more than a file of Python code. A module contains functions, classes, and variables. A module may also include functional code. If you want to build programs that are easy to comprehend, dependable, and maintainable, you should utilize a proprietary programming framework. This is especially true if your application is extensive. Specific programming can be designed in a variety of ways. Writing computer programs, in particular, is an example of product structure innovation that divides your code into smaller portions. These components are referred to as modules.

The entire coding portions can divided into three parts, each of this sections can stores a lot of code which is interrelated to each other. two of the three modules had a few capabilities that were filled with explicit tasks, and the main module was turned into a basic module in which other modules were imported and their capabilities were filled with a range of activities. The main module executes the entire code and displays the results. Complete description of each module that can help you understand the general program growth as well as the operation of each module in the program. These modules were all kept in the same folder.

The portion were given below:

#### 3.1 Main.py

The ListSplit.py, ReturnCostume.py to utilize their functionalities for specific work, portions were imported into the main package. This portion is in charge of the program.

First of all, this modules shows the user variables details. As we enter lists, we collect information about them. If we choose 1, 2, it will import data from the imported Python files, show information, and prompt us to enter more

data as needed. If the user enters 3, the program will be closed. If we input an incorrect phrase, we should strive to rectify it as soon as possible.

### 3.2 ListSplit.py

This module generates a two-dimensional list of return and rent information from the files Text.txt and Borrower Rent.txt, which are both located in the same folder. The first function reads data from Text.txt, appends it to a two-dimensional list, and displays it while the code runs. The second method

extracts borrower information from borrower Rent.txt, appends it to a 2d list, and displays it as the code is running.

## 4. Testing

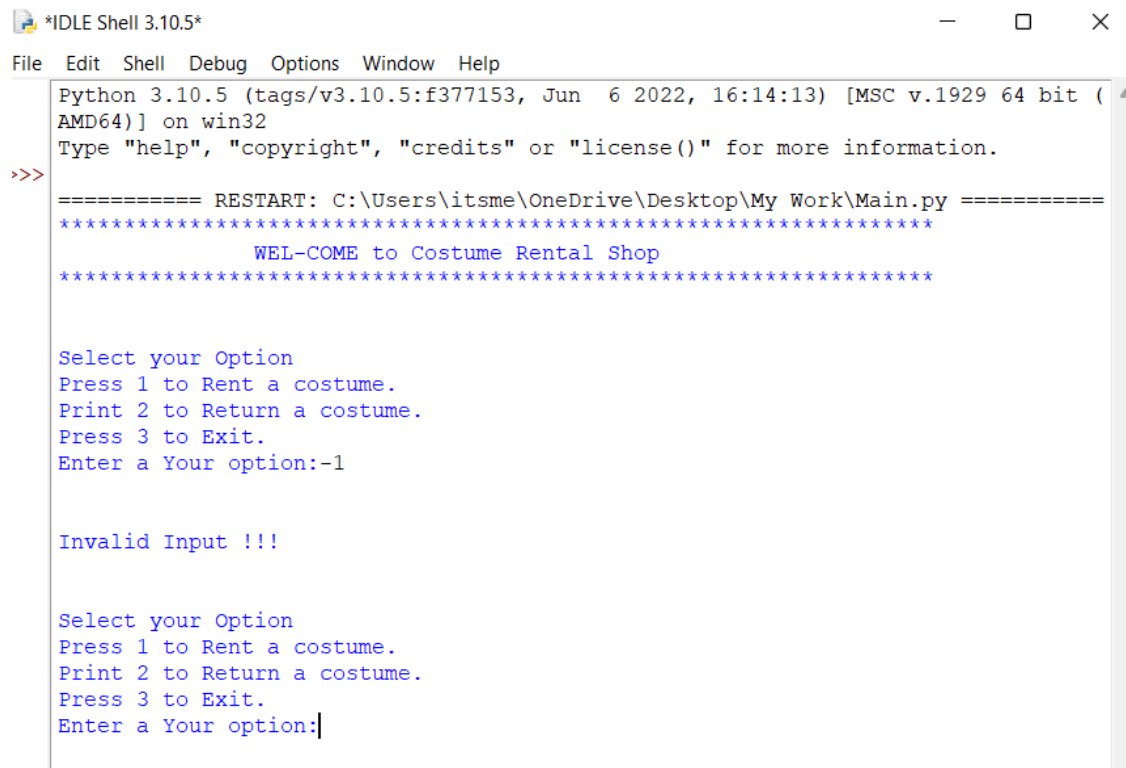

Testing is the process of checking the program should run well or not. It is very necessary to test your program while you are being a developer. It ensure your program that it is working well.

Here are some Testing which are performed to check my program:

### 4.1 Test 01

Test Number	01
Objective	Show implementation of try except
Action	Provide invalid input.
Expected Result	Program will execute and show invalid pop-pop message.
Actual Result	Test is successful.
Conclusion	Test is successful.

Table 1: Table for implementation of try except

```

Python 3.10.5 (tags/v3.10.5:f377153, Jun 6 2022, 16:14:13) [MSC v.1929 64 bit (AMD64)] on win32

#### 4.4 Test 04

Test Number	04
Objective	File Generating for returning the costume.
Action	1.Show complete renting process. 2.Show output in the shell as well. 3.Finally show the rented costume note in txt file.
Expected Result	Text File will be generated for return the costume.
Actual Result	Text file be generated successful.
Conclusion	Test is successful.

Figure 38: Figure of added in quantity while returning the costume process

## **5. Conclusion**

This was the 1<sup>st</sup> coursework of this Fundamental of Computing of module. This provides for 60% of our module grade. In this coursework, I had develop a bill generating system for a costume rental shop for maintain the record of the costumes available for renting in Python. The entire program was written using the Python IDLE software. I could divide the coding part in three parts. First one was ListSplit, another was ReturnCostume and at last but not the least Main file which was basically contained the main structure code of this assignement.

### **5.1 Difficulties**

While doing this 1<sup>st</sup> Assignment of this computing module I have been faced multiple difficulties. First, when I about to start this coursework, I have been no idea how and where to started from. I am little bit familiar from this coursework but even I couldn't get the situation. I have been asked my tutor again and he explain the scenario and then I got this.

### **5.2 How Can Faced those Difficulties**

To get overcome this type of difficulties I always discussed with my pals and got solution and I joined discussion class. One of the main reasons made me overcome from these difficulties is our great tutor. They are very friendly and kind. They assisted us while we stocked in any problem by solving these difficulties. Even I could also get some solution from internet and many others.

### **5.3 What Did I learn?**

While going through this assignment I am able to learn a lot about Python. First, it improved my coding, debugging skill and several of the ideas. And it can also clear my concept about the Bill Generating System of shops and stores.
